

Please note that our pre press requirements specify a 3mm bleed on the external of the die line - as displayed by the red line indicator on the example. This 3mm bleed should also carry onto the glue tab to avoid white stripes on the glue seam of the box

It is also suggested that you consider a 3mm internal bleed as the "safe zone" for your print - As displayed by the green line indicator.

This 3mm internal margin ensures that no words or important elements get sliced off in the diecut!
